

1. Corpus Summary

The corpus contains 715,935 total words and 17,272 unique word forms across the six job-description documents.

2. Document-Level Statistics

(Use this block directly in your write-up.)

Document Length (words)

- JobDescription_data_0: 68,841
- JobDescription_data_1: 130,908
- JobDescription_data_2: 131,951
- JobDescription_data_3: 135,402
- JobDescription_data_4: 122,768
- JobDescription_data_5: 126,065

Vocabulary Density (type/token ratio)

- JobDescription_data_0: 0.069
- JobDescription_data_1: 0.051
- JobDescription_data_2: 0.053
- JobDescription_data_3: 0.053
- JobDescription_data_4: 0.053
- JobDescription_data_5: 0.054

Average Words per Sentence

- JobDescription_data_0: 31.7
- JobDescription_data_1: 31.1
- JobDescription_data_2: 30.8
- JobDescription_data_3: 30.7
- JobDescription_data_4: 29.1
- JobDescription_data_5: 28.9

Readability Index

- Highest: JobDescription_data_2 (16.272)
- Lowest: JobDescription_data_4 (15.233)

3. The word cloud shows that the job descriptions revolve around data-heavy roles, with terms like “data,” “experience,” “SQL,” “business,” and “database” dominating the corpus. The emphasis is clearly on technical skills, data management, and prior experience, which signals the core requirements of these positions.

4. The word tree shows that “data” appears in predictable job-description contexts, usually tied to processing, management, and warehouse work. The branches make it clear that the term anchors most of the technical responsibilities across these documents.

5. The bar chart shows that every document relies heavily on the term “data,” but Documents 5 and 6 use it the most by a wide margin. The pattern reinforces that all six roles are data-centric, with some positions leaning even more heavily on data-related responsibilities.

6. The line chart shows that “data” is consistently the most frequent term across all documents, while “SQL” varies more sharply from role to role, peaking in a few technical postings. “Python” barely appears at all, suggesting that most of these positions emphasize data handling and SQL skills far more than Python programming.

7. The keyword-in-context view shows that “data” consistently appears alongside terms like warehousing, management, risk, and technical tools, which fits the nature of these job descriptions. Overall, the contexts make it clear that data is tied directly to core operational and analytical responsibilities across all six roles.
