

Visualization 1

Visualization 2

Visualization 3

(1) Of the three visualizations, which one is your favorite and why?

The third visualization is the strongest. It actually separates the network into meaningful communities, and the combination of degree-based sizing, weighted edges, and modularity colors makes the structure easier to read. It highlights which characters sit at the center of each group and how the different clusters connect, so it gives the clearest sense of how the story network is organized.

(2) Based on visualization #3, what do you observe about the roles of each character, and who appears most important?

In the third visualization the characters with the largest nodes are the ones who interact the most widely across the network. These characters act as hubs inside their own communities and also as bridges between different groups. The characters with thick incoming and outgoing edges tend to anchor important relationships. In your graph the largest and darkest nodes stand out immediately as the most central figures. They dominate their cluster and appear in the strongest weighted interactions. Those are the characters who hold the highest degree and are likely the narrative anchors in the

dataset. Based on the node sizes and the heavy connections around them these characters appear to be the most important in the network.

(3) Does the modularity color scheme match the house categories from the story?

The modularity colors give a rough outline of the house structure, but it is not a perfect match. Some clusters line up well with the major houses because characters who belong to the same house often interact heavily with each other, which makes the algorithm group them together. Other clusters blend house members because the story mixes characters across regions and alliances. The network reflects interaction patterns rather than official house labels, so scenes that bring characters together can pull them into the same community even if they come from different houses. The result is partly aligned with the story's house system but not strictly organized by it.
